

METHOD OF ROUTING AND PROCESSING DOCUMENT IMAGES SENT  
USING A DIGITAL SCANNER AND TRANSCEIVER

5

ABSTRACT OF THE DISCLOSURE

A method and apparatus for flexible control of the routing and processing of documents by a document receiver. Document classifications are defined by a receiver and stored on a registration server together with an associated document processing profile ("DPP"). The receiver communicates to a sender how to access his account on the registration server. The sender views the receiver's document classifications, selects one, and prints a cover page, which includes a document classification identifier. The sender scans the cover page and a source document with a digital scanner and transceiver. The document is sent to recipients and transformed according to the DPP.
